## Light Local Footprint. Deep Cloud Benefits.

SIRIS Lite brings award-winning SIRIS technology to a whole new market. Using a simplified local appliance, SIRIS Lite brings all the benefits of a powerful backup agent and Inverse Chain Technology at a price small businesses can afford.

# Simple Local Backup Meets Powerful Cloud Services

## The Light Local Footprint

SIRIS Lite utilises a revolutionary technology that dramatically simplifies the backup and recovery process. By employing proprietary Inverse Chain Technology, SIRIS Lite eliminates the inherent inefficiency of the traditional backup chain. SIRIS Lite takes data directly from the server and converts it into virtual machine readable files. These files can then be booted instantly from a web interface or by using any common hypervisor. This innovative way of storing data allows for instant recovery and can prevent downtime in the event of a disaster, offering the peace of mind that backups will be available at a moment's notice.

### SIRIS, SIRIS Lite...What's The Difference?

SIRIS and SIRIS Lite use the same proven technology, with the same recovery and support options. SIRIS Lite is capable of virtualised backups, but differs in that the appliances do not support local virtualisation or screenshot verification.

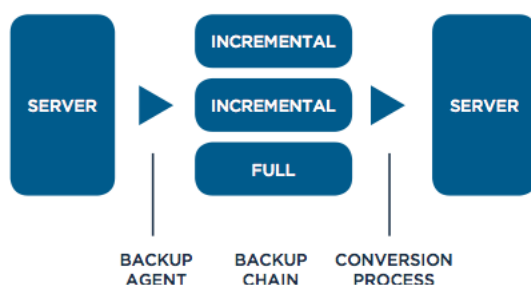

### The Best Local Backup

SIRIS Lite takes advantage of StorageCraft's reliable snapshot engine, providing some of the world's most stable local backups. StorageCraft's technology allows SIRIS Lite to backup even when VSS Writers are in failed states.

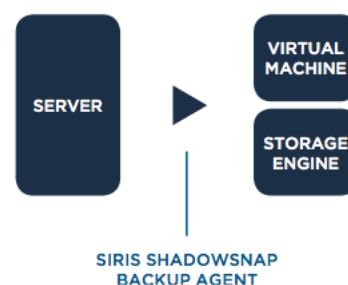

### Break Free From the Chain

The SIRIS Lite backup process eliminates the area where most problems arise in the traditional backup process: the backup chain. SIRIS Lite takes data and converts it directly into a virtual machine each time a backup occurs. The most recent backup image is always the base image and does not rely on past incrementals to restore data. Since each backup is a fully bootable virtual machine, there is no need for a conversion prior to performing a restore. With no complicated rollup or restore processes, data is always available immediately.

#### TRADITIONAL BACKUP PROCESS

#### SIRIS SIMPLIFIED BACKUP PROCESS

## Instant Off-Site Virtualisation

In just seconds, backups can be remotely virtualised from the SIRIS Lite appliance in Datto's secure cloud. The advanced web interface allows for configuration of CPU and Memory resources. Network resources can be configured dynamically, allowing for changes to be made without restarting the virtual machine. Even while virtualised, systems can continue to backup to the SIRIS Lite appliance and Datto's secure cloud.

## Future Ready

SIRIS Lite appliances support the latest standards and are continuously being updated. Every SIRIS Lite appliance supports software RAID and 2TB+ Volumes including advanced format drives. SIRIS Lite appliances also support GPT Partition formats including those using EFI Boot. SIRIS Lite is capable of backing up both physical and virtual systems with nearly any storage configuration. All SIRIS Lite appliances regularly download and install updates in the background, ensuring that every device is always running the latest version.

## Centralised Management

All Datto appliances are controlled through an easy to use central web interface. This interface allows for quick access to critical stats and has detailed remote management ability. Through the interface it is possible to virtualise a failed server on an appliance that may be hundreds of miles away with just a few clicks. The interface even allows for RDP access to remote servers and VMs through a secure VPN connection.

## Broad Operating System Support

SIRIS Lite appliances support the widest array of operating systems of any BDR Product on the market. With support for Windows 2000, XP, 2003, Vista, 2008 and 7, SIRIS Lite supports almost any Windows system still in production today.

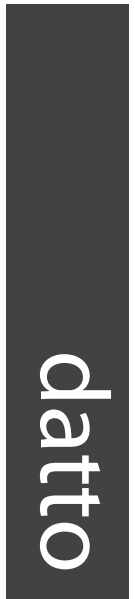

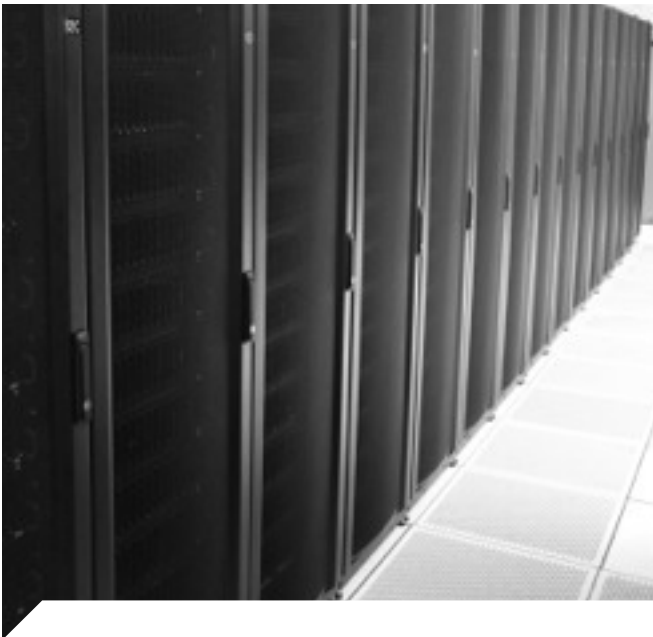

## Better Bare Metal Restore

SIRIS Lite devices use a completely unique method for performing bare metal restores. Rather than use a limited restore environment that fits on a single CD, SIRIS Lite supports network BMR. The SIRIS Lite device acts as a network boot server allowing the destination system to be booted using PXE Boot (Common on almost all systems newer than 2001). SIRIS also supports restoring to smaller volumes, a feature absent in many competing products.

"Ever since River Run Computers, Inc. started providing Datto's SIRIS Lite solution for our clients' business continuity needs, we saw an immediate spike in recurring revenue and overall company growth. We have deployed more backup solutions in the past six months than in three years of selling a competing solution."

-Eric Torres  
River Run Computers

## About Datto

Datto is a team of passionate individuals dedicated to executing Datto's mission of providing the world's best backup and disaster recovery solutions that provide complete end-to-end business continuity.

Founded in 2007, Datto is changing how companies protect their information. Datto systems are scalable and offer a full spectrum of solutions that can satisfy both the small business owner and large enterprise businesses.

Datto's backup and disaster recovery solutions are available exclusively through Datto Resale Partners – over 2,500 IT Providers across North America and Europe. Companies trust Datto for their data security and business continuity needs.

## Datto Product Comparison

|                                        | G Series | SIRIS Lite | SIRIS |
|----------------------------------------|----------|------------|-------|
| On-Site Backup                         | Yes      | Yes        | Yes   |
| Off-Site Backup                        | Yes      | Yes        | Yes   |
| Free US Based Technical Support        | Yes      | Yes        | Yes   |
| 3 Year Hardware Warranty               | Yes      | Yes        | Yes   |
| No Recovery Fees                       | Yes      | Yes        | Yes   |
| Bare Metal Restore                     | Optional | Yes        | Yes   |
| Data Deduplication & Local Compression | Yes      | Yes        | Yes   |
| Secure Linux Based OS                  | Yes      | Yes        | Yes   |
| ZFS Snapshots                          | Yes      | Yes        | Yes   |
| Message-Level Exchange Recovery        |          | Yes        | Yes   |
| Granular SharePoint Recovery           |          | Yes        | Yes   |
| Advanced File Level Restore            |          | Yes        | Yes   |
| Instant Off-Site Virtualisation        |          | Yes        | Yes   |
| VMDK/VHD Export                        |          | Yes        | Yes   |
| Instant On-Site Virtualisation         |          |            | Yes   |
| Screenshot Verification of Backups     |          |            | Yes   |
