

readme.txt

MIS Lock.exe checks for 2 registry entries in HKLM -> Software -> Bushey Meads -> MIS Monitor to determine which processes to check for and the time to adjust the screen lock delay to. It requires a DWORD value called timeout for the delay time, and a REG_SZ value called processes for the process names. The names should be separated by semi-colons. Process names are not case sensitive.

To disable the program set a DWORD registry entry in HKCU -> software -> Bushey Meads -> MIS Monitor called disable with a value of 1.

Added a debug mode that leaves the console window visible and prints to it what's happening at each stage. DWORD registry entry of debug in HKLM -> Software -> Bushey Meads -> MIS Monitor with value of 1 for debug mode.
